

PERHITUNGAN EVAPOTRANSPIRASI

Tujuan

- Menentukan besarnya evapotranspirasi tanaman referensi (ET_o) (kebutuhan air tanaman referensi atau *crop water requirement*) dengan beberapa metode.
- Membandingkan metode-metode penghitungan Evapotranspirasi tanaman referensi

Dasar Teori

Pada akhir tahun 1940-an diperkenalkanlah konsep Evapotranspirasi Potensial (PET), yaitu besar evapotranspirasi per satuan waktu tertentu untuk tanah yang sepenuhnya tertutup oleh tanaman budidaya hijau yang rendah. Tanah tersebut memiliki kadar air yang cukup (bukan tanah kering).

Pada awal tahun 1980-an, konsep ini dikoreksi, karena PET tidak langsung berkaitan dengan jenis tanaman tertentu. Muncullah konsep ET_o , dimana tanaman yang digunakan adalah rumput (alfalfa) hijau dengan tinggi yang seragam dan menutupi permukaan tanah dengan kadar air yang cukup (tidak kering). Nilai ET_o disebut nilai evapotranspirasi tanaman referensi (*reference evapotranspiration*). ET_o tanaman-tanaman lain diperoleh dengan mengalikan sebuah konstanta koefisien tanaman (k_c).

Penentuan besarnya nilai kebutuhan air tanaman bisa dihitung berdasarkan persamaan empiris yang telah dikembangkan oleh beberapa peneliti, maupun pengukuran secara langsung di lapangan. Modifikasi formula empiris tersebut banyak dilakukan oleh peneliti dengan mempertimbangkan ketersediaan data klimatologi, ketelitian hasil perhitungan, tujuan pemanfaatan, nilai kebutuhan tanaman tersebut dan lain-lain. Beberapa formulasi yang telah dikenal diantaranya adalah metode Blaney-Criddle, Penman, Radiasi, dll, yang mempunyai kelebihan dan kekurangan masing-masing.

Pada Praktikum ini akan dibahas beberapa metode diantaranya :

1. Metode Blaney Criddle
2. Metode Radiasi
3. Metode Penman-Monteith
4. Metode Pan Evaporation

1. Metode Blaney-Criddle

Persamaan asli Blaney-Criddle (1950) memasukkan perhitungan faktor kebutuhan air konsumtif (f) dari temperatur rata-rata (T), and persentase (p) dari total jam penyinaran cerah tahunan dalam periode yang diinginkan ($f = p \cdot T/100$). Kemudian sebuah konstanta yang diperoleh secara empiris untuk kebutuhan konsumtif tanaman tertentu (K) juga diterapkan dalam perhitungan untuk memperoleh kebutuhan air konsumtif (CU), sehingga diperoleh rumus $CU = K \cdot f = K (p.T/100)$ dimana T dalam $^{\circ}F$. CU didefinisikan sebagai **jumlah air yang secara potensial dibutuhkan untuk memenuhi kebutuhan evapotranspirasi**.

Namun karena pengaruh iklim terhadap kebutuhan air tidak cukup hanya dengan mempertimbangkan temperatur dan panjang hari, maka digunakan perhitungan yang masih

menggunakan faktor T dan f, metode ini digunakan untuk menghitung Evapotranspirasi referensi tanaman (ET_o)

$$ET_o = c \cdot [p \cdot (0.46T + 8)], \text{ mm/hari}$$

dimana :

- ET_o = Evapotranspirasi referensi tanaman dalam mm/hari untuk bulan yang diperhitungkan
- T = Temperatur harian rata-rata dalam °C dalam bulan yang diperhitungkan
- p = Persentase rata-rata harian dari total jam siang yang diperoleh dari tabel 1. untuk tiap bulan dan lintang yang diketahui.
- c = Adjustment faktor yang tergantung dari kelembaban relatif (RH) minimum, jam hari cerah dan angin sepanjang siang

setelah menghitung ET_o , maka dapat ditentukan ET crop dengan mengalikan ET_o dan koefisien tanaman (k_c), atau dirumuskan :

$$ET_{crop} = k_c \cdot ET_o$$

Contoh Perhitungan

Diketahui :

Kairo, Republik Mesir, Latitude 30° N ; Altitude 95 m; Juli

Perhitungan :

Tmax	Σ Nilai Tmax harian /31	35° C
Tmin	Σ Nilai Tmin harian /31	22° C
Tharian rata-rata	Σ Trataan/31 atau $[(\Sigma Tmax/31)+(\Sigma Tmin/31)]/2$	28.5°C
p	dari Tabel 1 untuk 30°N	0.31
$p(0.46T + 8)$	$0.31(0.46 \times 28.5 + 8)$	6.6 mm/hari
RHmin	Data Klimatologi	medium
n/N	Data Klimatologi	high to medium
U_2 siang hari	Data Klimatologi	moderate
ET_o	Gambar 1, Blok 5 (baris 2)	8.0 mm/hari

Yearly data (using measured temperature data)

Format untuk Kalkulasi dengan Metode Perhitungan Blaney-Criddle

Gambar 1. RH minimum dan Panjang Hari Siang, dan Kecepatan Angin Siang Hari

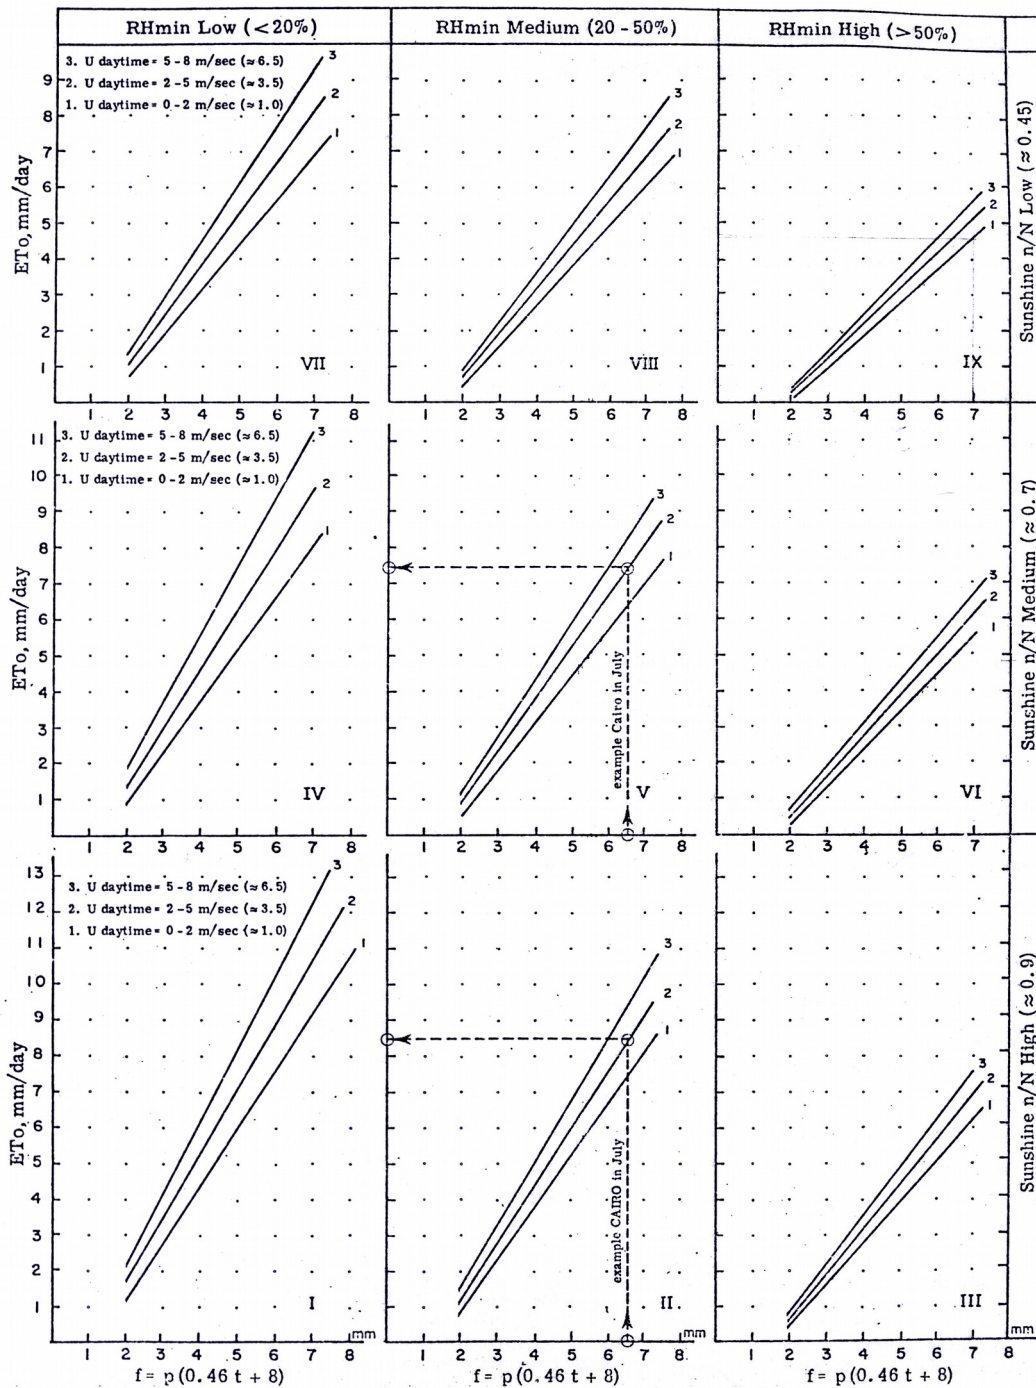

Fig. 1 Prediction of ETo from Blaney-Cridde f factor for different conditions of minimum relative humidity, sunshine duration and day time wind.

2. Metode Radiasi

Metode Radiasi pada dasarnya adalah adaptasi dari Rumus Makkink (1957). Metode ini disarankan untuk daerah dimana data-data iklim yang tersedia termasuk temperatur udara, penyinaran matahari, keadaan awan atau radiasi, namun tidak termasuk kecepatan angin dan kelembaban. Dibandingkan dengan metode Blaney-Criddle, metode ini memberikan input yang lebih sedikit. Pada beberapa kasus untuk daerah equatorial, pulau kecil atau daerah yang punya altitude tinggi, Metode Radiasi lebih baik dari Metode Blaney-Criddle. Rumus yang direkomendasikan untuk Metode Radiasi adalah :

$$ET_o = c \cdot (W \cdot R_s), \text{ mm/hari}$$

dimana :

- ET_o = Evapotranspirasi referensi tanaman dalam mm/hari untuk periode yang diperhitungkan
- R_s = Radiasi matahari dalam ekuivalen Evaporasi, mm/hari
- W = Weighing factor yang tergantung dari Temperatur dan Altitude
- c = Adjustment faktor yang tergantung dari kelembaban relatif (RH) rata-rata dan angin sepanjang siang

Untuk menghitung R_s dari lama penyinaran matahari (*sunshine duration*) atau radiasi surya, untuk menentukan weighing factor (W) dari temperatur dan altitude data, dan untuk memilih nilai c yang tepat berdasarkan hubungan antara W.R_s dan ET_o pada gambar 2 untuk beberapa nilai kelembaban rata-rata dan kondisi angin siang hari, maka digunakan prosedur di bawah ini ;

a. Radiasi Surya

R_a adalah radiasi yang diterima oleh atmosfer yang paling atas, sebagian dari R_a diserap dan tersebar saat melewati atmosfer. Bagian dari R_a termasuk yang tersebar dan mengenai permukaan tanah diidentifikasi sebagai R_s.

R_s dapat diukur secara langsung, namun dapat juga dihitung dari data lama penyinaran seperti pada persamaan :

$R_s = (0.25 + 0.50 \frac{n}{N}) \cdot R_a$ dimana n/N adalah rasio antara lama (jam) cerah dan kemungkinan maksimum jam cerah (*sunshine hours*). N diperoleh dari tabel 3. Data n diambil dari Campbell Stokes sunshine recorder. Nilai R_a untuk lintang dan bulan yang berbeda diberikan pada tabel 2.

Contoh :

Diketahui :

Kairo, Latitude 30°N, Juli, sunshine (n), rata-rata 1.5 jam/hari

Perhitungan :

R _a	dari Tabel 2.	= 6.8 mm/hari
N	dari Tabel 3.	= 3.9 mm/hari
R _s	$(0.25 + 0.50 \frac{n}{N})R_a$	= $(0.25 + 0.50 (1.5/3.9)) \times 6.8$ = 11.2 mm/hari

b. Weighting Factor (W)

Weighting factor menunjukkan efek temperature dan altitude terhadap hubungan antara R_s dan ET_o. Nilai W yang berkaitan dengan temperatur dan altitude diberikan di tabel 4.

Contoh :

Diketahui :

Kairo, Altitude 95 m, Trata-rata : 28.5 °C

Perhitungan :

W dari Tabel 4. = 0.77

c. Adjustment Factor (c)

Adjustment factor diberikan sebagai hubungan antara bagian radiasi ($W.R_s$) dan Evapotranspirasi referensi tanaman (ET_o) ditunjukkan pada grafik gambar 2. Sebagian besar tergantung pada rata-rata RH dan kecepatan angin hari siang (*daytime wind*) (mulai jam 07.00 – 19.00) pada ketinggian 2 m dari permukaan tanah

Contoh :

Diketahui :

Kairo, latitude 30°, altitude 95 m, Juli, $R_s = 1.2$ mm/hari, $W = 0.77$, $W.R_s = 8.6$ mm/hari, angin hari siang (*wind daytime*) = moderate, RH rata-rata = medium

Perhitungan :

Dari Gambar 2. RH rata-rata = medium
 Uday = medium
 ET_o (untuk $W.R_s = 8.6$ mm/hari) = $(8.7 + 8.0)/2$
 = 8.4 mm/hari

Contoh Perhitungan

Diketahui :

Kairo, Republik Mesir, Latitude 30° N ; Altitude 95 m; Juli . Trata-rata = 28.5 °C, sunshine (n) rata-rata = 1.5 jam/hari; angin hari siang (*wind daytime*) U = moderate; Rhrata-rata = medium

Perhitungan :

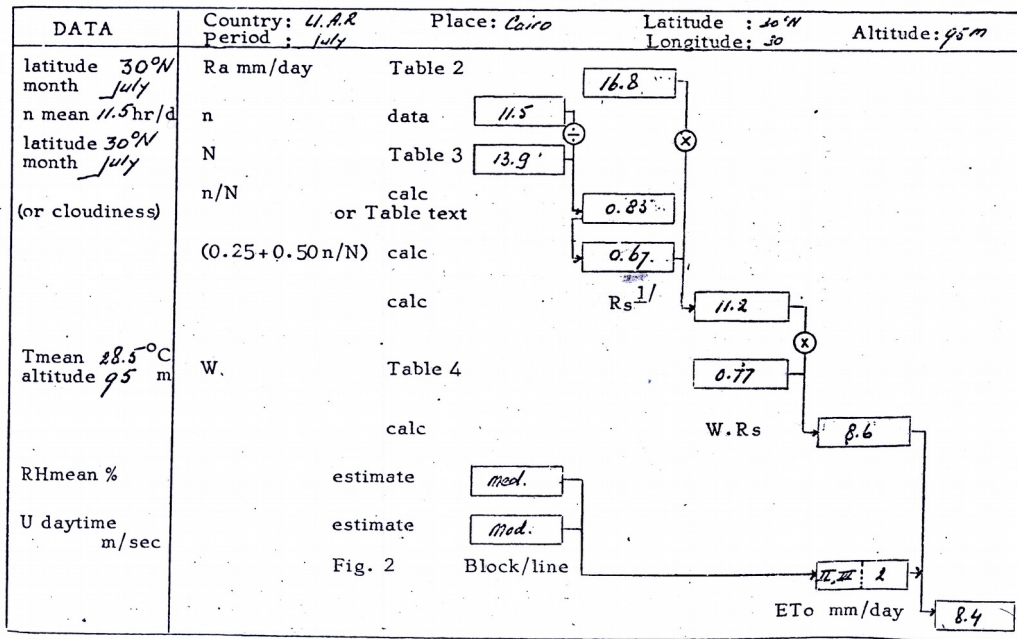

R_a dari Tabel 2. 6.8 mm/hari
 R_s $(0.25 + 0.5 n/N) .R_a$ n = 11.5 jam/hari
 N = 13.9 jam/hari
 n/N = 0.83
 R_s = 11.2 mm/hari
 W dari Tabel 4. 0.77
 $W.R_s$ 8.6 mm/hari
 ET_o dari Gambar 2, Blok II dan III Baris 3 8.4 mm/hari

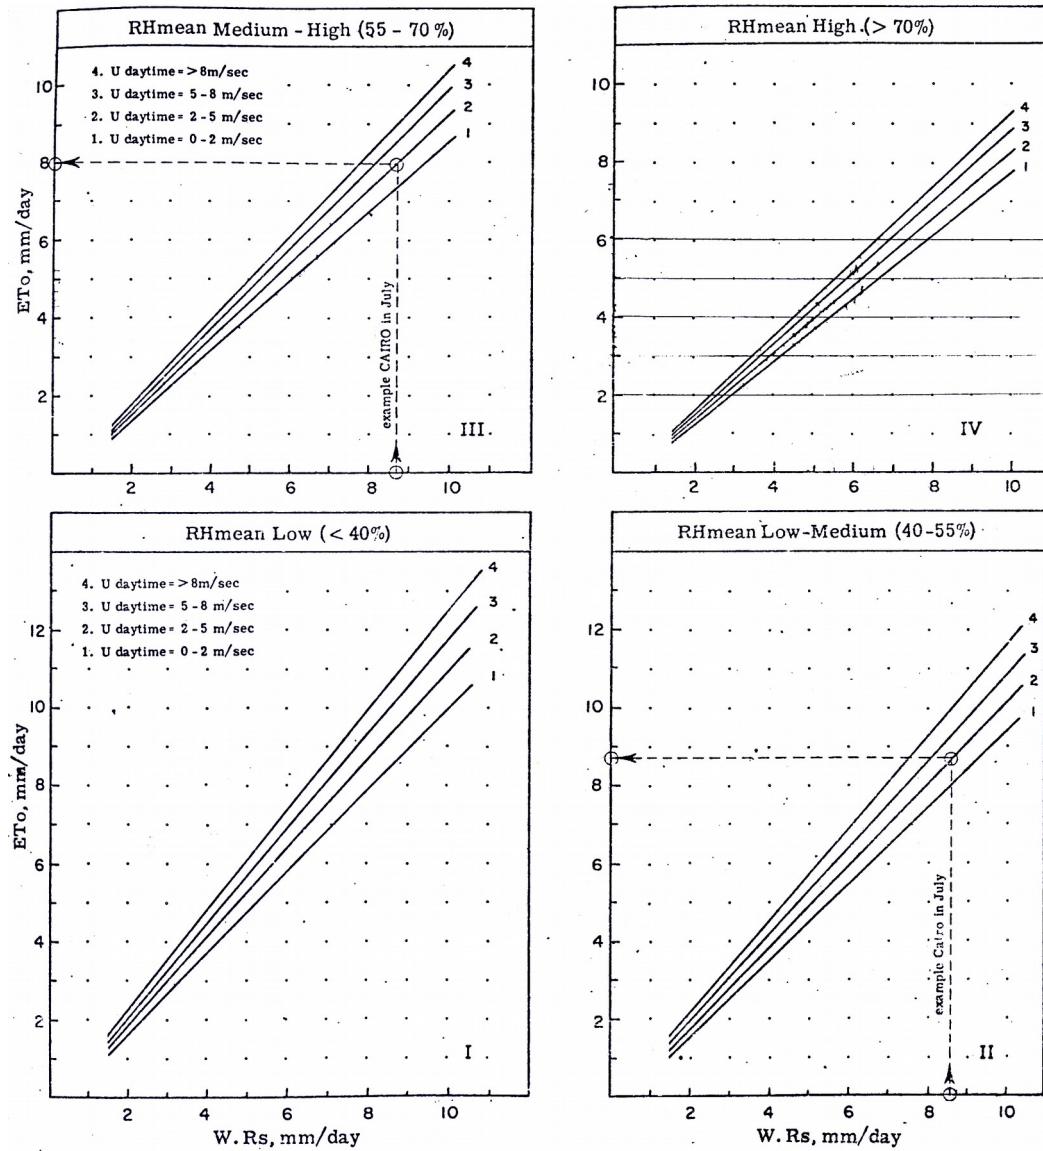

Fig. 2 Prediction of ET_0 from $W.R_s$ for different conditions of mean relative humidity and day time wind.

3. Metode Penman

Penman, pada tahun 1948 mengajukan persamaan untuk menghitung evapotranspirasi ;

$$E_o = \frac{\Delta H + \gamma E_a}{\Delta + \gamma}$$

dimana :

- E_o = Evapotranspirasi referensi tanaman dalam mm/hari untuk periode yang diperhitungkan
- H = Faktor yang bergantung pada radiasi dan panjang penyinaran
- E_a = Faktor yang tergantung pada kecepatan angin dan tekanan uap
- Δ/γ = Parameter empiris yang bergantung pada temperatur

Penjabaran persamaan-persamaan tersebut dapat dicari pada berbagai literatur, namun untuk keperluan praktis telah dikembangkan nomogram yang mempermudah perhitungan. Prinsip nomogram tersebut adalah secara grafis memplot nilai-nilai yang diketahui sehingga diperoleh nilai E_o yang dicari.

Data-data input yang diperlukan untuk menghitung E_o menggunakan nomogram Penman adalah :

- Suhu udara rata-rata (t , °C)
- Kelembaban rata-rata (h)
- Penutupan langit oleh awan (n/D)
- Kecepatan angin rata-rata (u_2 , m/s)
- Radiasi gelombang pendek (R_A , g/cal/cm²/day)

Contoh Perhitungan

Diketahui suhu udara rata-rata = 18 °C

$n/D = 0.4$; $R_A = 800$ g cal/cm²/day; $h = 0.6$; $u_2 = 3$ m/s

maka penyelesaian penggunaan nomogram adalah

$$E_o = E_1 + E_2 + E_3 + E_4$$

E_1 diperoleh dengan menarik garis antara t dan n/D

E_2 diperoleh dengan menarik garis antara t dan n/D lalu hasilnya ditarik garis ke R_A

E_3 diperoleh dengan menarik garis antara t dan h , lalu hasilnya ditarik garis ke n/D

E_4 diperoleh dengan menarik garis antara t dan u_2 , lalu hasilnya ditarik ke h

Cara menarik garis dapat dilihat pada Gambar 3.

Tabel 5. Nilai R_A (g cal/cm²/day)

Gambar 3. Nomogram Penman

3. Metode Penman-Monteith

Untuk daerah dimana tersedia data-data temperature, kelembaban, angin dan durasi hari cerah, atau radiasi, maka adaptasi dari metode Penmann sangat disarankan. Metode Penman pertama kali diintroduksi pada tahun 1948. Namun dalam perkembangannya, metode ini disempurnakan oleh Monteith.

Metode Penman-Monteith yang diadaptasi oleh FAO dipertahankan sebagai standar untuk menghitung ET_o dari data meteorologi

$$ET_o = \frac{0.408 \cdot \Delta(R_n - G) + \gamma \frac{900}{T+273} u_2 (e_s - e_a)}{\Delta + \gamma(1 + 0.34 \cdot u_2)}, \text{ mm/hari}$$

dimana :

- ET_o = Evapotranspirasi referensi tanaman dalam mm/hari untuk periode yang diperhitungkan
- R_n = Radiasi matahari Net pada permukaan tanaman (MJ/m.hari)
- G = Kerapatan flux panas pada tanah (MJ/m.hari)
- T = Temperatur udara pada ketinggian 2 m ($^{\circ}\text{C}$)
- u_2 = Kecepatan angin pada ketinggian 2 m dari permukaan (m/detik)
- e_s = Tekanan uap jenuh (kPa)
- e_a = Tekanan uap aktual (kPa)
- $e_s - e_a$ = Defisit tekanan uap jenuh (kPa)
- Δ = Kemiringan kurva tekanan uap (kPa/ $^{\circ}\text{C}$)
- γ = Konstanta psikrometrik (kPa/ $^{\circ}\text{C}$)

BOX 11					
Calculation sheet for ET_0 (FAO Penman-Monteith) using meteorological tables of Annex 2					
Parameters					
T_{max}		°C			
T_{min}		°C	$T_{mean} = (T_{max} + T_{min})/2$		°C

31						

TABAE 2.□ add 1 if leap year

J can be determined for each day (D) of month (M) by

$$J = \text{INTEGER}(275 M/9 - 30 + D) - 2$$

IF (M < 3) THEN J = J + 2

also,

IF (leap year and (M > 2)) THEN J = J + 1

For ten-day calculations, compute J for day D = 5, 15 and 25

For monthly calculations, J at the middle of the month is approximately given by

$$J = \text{INTEGER}(30.4 M - 15)$$

TABLE 2.6. Daily extraterrestrial radiation (Ra) for different latitudes for the 15th day of the month¹

$$R_a = \frac{24(60)}{\pi} G_{sc} \cos \varphi [\omega_s \sin \varphi \sin(\delta) + \cos \varphi \cos(\delta) \sin(\omega_s)] \quad (\text{Eq. 21})$$

(values in MJ m₋₂ day⁻¹)²

- ¹ Values for Ra on the 15th day of the month provide a good estimate (error < 1 %) of Ra averaged over all days within the month. Only for high latitudes greater than 55° (N or S) during winter months deviations may be more than 1%.
- ² Values can be converted to equivalent values in mm/day by dividing by Lambda = 2.45.

TABLE 2.7. Mean daylight hours (N) for different latitudes for the 15th of the month¹

$$N = \frac{24}{\pi} \omega_s \quad (\text{Eq. 34})$$

EXAMPLE 17			
Determination of ET_0 with mean monthly data			
Given the monthly average climatic data of April of Bangkok (Thailand) located at 13°44'N and at an elevation of 2 m:			
-	Monthly average daily maximum temperature (T_{max}) =	34.8	°C
-	Monthly average daily minimum temperature (T_{min}) =	25.6	°C
-	Monthly average daily vapour pressure (e_a) =	2.85	kPa
Measured at 2 m	Monthly average daily wind speed (u_2) =	2	m/s
-	Monthly average sunshine duration (n) =	8.5	hours/day
For April	Mean monthly average temperature ($T_{month,i}$) =	30.2	°C
For March	Mean monthly average temperature ($T_{month,i-1}$) =	29.2	°C
Determination according to outline of Box 11 (calculation sheet ET_0)			
Parameters			
-	$T_{mean} = [(T_{max} = 34.8) + (T_{min} = 25.6)]/2 =$	30.2	°C
From Table 2.4 or Eq. 13:	$\Delta =$	0.246	kPa/°C
From Table 2.1 and Table 2.2 or Eq. 7 and Eq. 8:	Altitude =	2	m
	P =	101.3	kPa
	$\gamma =$	0.0674	kPa/°C
-	$(1 + 0.34 u_2) =$	1.68	-
-	$\Delta[\Delta + \gamma(1 + 0.34 u_2)] = 0.246 / [(0.246 + 0.0674 (1.68))] =$	0.685	-
-	$\gamma[\Delta + \gamma(1 + 0.34 u_2)] = 0.0667 / [0.246 + 0.0674 (1.68)] =$	0.188	-
-	$900 / (T_{mean} + 273) u_2 =$	5.94	-
Vapour pressure deficit			
From Table 2.3 or Eq. 11:	$T_{max} =$	34.8	°C
	$e^{\circ}(T_{max}) =$	5.56	kPa
From Table 2.3 or Eq. 11:	$T_{min} =$	25.6	°C
	$e^{\circ}(T_{min}) =$	3.28	kPa
-	$e_s = (5.56 + 3.28)/2 =$	4.42	kPa
Given	$e_a =$	2.85	kPa
-	Vapour pressure deficit ($e_s - e_a$) = (4.42 - 2.85) =	1.57	kPa

Radiation (for month = April)			
From Table 2.6 or 2.5 or Eq. 21:	J = (for 15 April)	105	-
	Latitude = 13°44'N = (13 + 44/60) =	13.73	°N
	$R_a =$	38.06	MJ m ⁻² day ⁻¹
N (Table 2.7 or Eq. 34):	Daylength N =	12.31	hours
-	$n/N = (8.5/12.31) =$	0.69	-
-	$R_s = [0.25 + 0.50 (0.69)] 38.06 =$	22.65	MJ m ⁻² day ⁻¹
-	$R_{s0} = (0.75 + 2 (2/100 000)) 38.06 =$	28.54	MJ m ⁻² day ⁻¹
-	$R_s/R_{s0} = (22.65/28.54) =$	0.79	-
-	$R_{ns} = 0.77 (22.65) =$	17.44	MJ m ⁻² day ⁻¹
From Table 2.8:	$T_{max} =$	34.8	°C
	$\sigma T_{max}^4 =$	44.10	MJ m ⁻² day ⁻¹
From Table 2.8:	$T_{min} =$	25.6	°C
	$\sigma T_{min}^4 =$	39.06	MJ m ⁻² day ⁻¹
-	$(\sigma T_{max}^4 + \sigma T_{min}^4)/2 = (44.10 + 39.06)/2 =$	41.58	MJ m ⁻² day ⁻¹
For:	$e_a =$	2.85	kPa
Then:	$(0.34 - 0.14 \sqrt{e_a}) / D_r$	0.10	-
For:	$R_s/R_{s0} =$	0.79	-
Then:	$(1.35 R_s/R_{s0} - 0.35) =$	0.72	-
-	$R_{nl} = 41.58 (0.10) 0.72 =$	3.11	MJ m ⁻² day ⁻¹
-	$R_n = (17.44 - 3.11) =$	14.33	MJ m ⁻² day ⁻¹
-	$G = 0.14 (30.2 - 29.2) =$	0.14	MJ m ⁻² day ⁻¹
-	$(R_n - G) = (14.33 - 0.14) =$	14.19	MJ m ⁻² day ⁻¹

Radiation (for month = April)			
From Table 2.6 or 2.5 or Eq. 21:	J = (for 15 April) Latitude = $13^{\circ}44'N = (13 + 44/60) =$ $R_a =$	105 13.73 38.06	- °N $MJ\ m^{-2}\ day^{-1}$
N (Table 2.7 or Eq. 34):	Daylength N =	12.31	hours
-	$n/N = (8.5/12.31) =$	0.69	-
-	$R_s = [0.25 + 0.50 (0.69)] 38.06 =$	22.65	$MJ\ m^{-2}\ day^{-1}$
-	$R_{s0} = (0.75 + 2 (2)/100\ 000) 38.06 =$	28.54	$MJ\ m^{-2}\ day^{-1}$
-	$R_s/R_{s0} = (22.65/28.54) =$	0.79	-
-	$R_{ns} = 0.77 (22.65) =$	17.44	$MJ\ m^{-2}\ day^{-1}$
From Table 2.8:	$T_{max} =$	34.8	°C
	$\sigma T_{max}^4 =$	44.10	$MJ\ m^{-2}\ day^{-1}$
From Table 2.8:	$T_{min} =$	25.6	°C
	$\sigma T_{min}^4 =$	39.06	$MJ\ m^{-2}\ day^{-1}$
-	$(\sigma T_{max}^4 + \sigma T_{min}^4)/2 = (44.10 + 39.06)/2 =$	41.58	$MJ\ m^{-2}\ day^{-1}$
For:	$e_a =$	2.85	kPa
Then:	$(0.34 - 0.14 \sqrt{e_a}) =$	0.10	-
For:	$R_s/R_{s0} =$	0.79	-
Then:	$(1.35 R_s/R_{s0} - 0.35) =$	0.72	-
-	$R_{nl} = 41.58 (0.10) 0.72 =$	3.11	$MJ\ m^{-2}\ day^{-1}$
-	$R_n = (17.44 - 3.11) =$	14.33	$MJ\ m^{-2}\ day^{-1}$
-	$G = 0.14 (30.2 - 29.2) =$	0.14	$MJ\ m^{-2}\ day^{-1}$
-	$(R_n - G) = (14.33 - 0.14) =$	14.19	$MJ\ m^{-2}\ day^{-1}$
-	$0.408 (R_n - G) =$	5.79	mm/day
Grass reference evapotranspiration			
-	$0.408 (R_n - G) \Delta / [\Delta + \gamma(1 + 0.34u_2)] =$		
-	$(5.79) 0.685 =$	3.97	mm/day
-	$900u_2 / (T + 273) (e_s - e_a) \gamma / [\Delta + \gamma(1 + 0.34u_2)] =$		
-	$5.94(1.57)0.188 =$	1.75	mm/day
-	$ET_0 = (3.97 + 1.75) =$	5.72	mm/day
The grass reference evapotranspiration is 5.7 mm/day.			

4. Metode Pan Evaporation

Laju evaporasi dari panci yang diisi dengan air sangat mudah sekali untuk diteliti. Dengan tidak adanya hujan, jumlah air yang diuapkan selama periode tertentu (mm/hari) sebanding dengan penurunan air panci pada periode tersebut. Panci membutuhkan pengukuran yang terintegrasi antara efek radiasi, angin, temperatur, dan kelembaban dan penguapan dari permukaan air bebas. Walaupun respon panci terhadap faktor iklim terkadang sama dengan respon tanaman, namun perlu terdapat beberapa faktor yang signifikan yang menyebabkan keduanya berbeda.

Dengan adanya perbedaan antara pan-evaporation dengan permukaan tanaman, kegunaan panci untuk memprediksi ET_o untuk periode 10 hari atau lebih lama mungkin dapat mendekati.

Hubungan antara evaporasi panci dan evapotranspirasi referensi (ET_o) dinyatakan dalam koefisien empiris sebagai berikut :

$$ET_o = K_p \cdot E_{pan}, \text{ mm/hari}$$

dimana :

ET_o = Evapotranspirasi referensi (mm/hari)

K_p = Koefisien panci (-)

E_{pan} = Evaporasi panci (mm/hari)

Panci Evaporasi terdiri dari panci kelas A, dan Colorado Sunken Pan. Untuk memilih koefisien panci yang tepat, tidak hanya tergantung dari tipe panci tapi juga tergantung dari penutupan tanah oleh vegetasi pada stasiun pengukuran. Lingkungan sekitarnya seperti kecepatan angin dan kelembaban juga harus diperiksa. Ada dua kondisi panci pengukuran, dimana pada kasus A panci diletakkan pada lingkungan dengan rumput yang pendek dan disekitarnya adalah tanah kosong, sedangkan pada kasus B, panci diletakkan di tanah yang kosong dan disekitarnya terdapat penutupan tanah oleh vegetasi rumput

Kondisi Peletakkan Panci Evaporasi

Koefisien Panci untuk Panci Kelas A dan Panci Colorado Sunken pada berbagai penutupan tanah, kondisi iklim, dan fetch (jarak tutupan permukaan yang teridentifikasi) diberikan pada tabel 5 dan tabel 6. Sedangkan tabel 7, merupakan persamaan regresi yang digunakan untuk menghitung koefisien panci dan diperoleh dari tabel 5 dan 6. Rasio antara Evaporasi yang diperoleh dengan menggunakan Panci Kelas A dan Colorado Sunken Pan pada beberapa kondisi iklim yang berbeda diberikan pada tabel 8.

BOX 12
Description of Class A pan

The Class A Evaporation pan is circular, 120.7 cm in diameter and 25 cm deep. It is made of galvanized iron (22 gauge) or Monel metal (0.8 mm). The pan is mounted on a wooden open frame platform which is 15 cm above ground level. The soil is built up to within 5 cm of the bottom of the pan. The pan must be level. It is filled with water to 5 cm below the rim, and the water level should not be allowed to drop to more than 7.5 cm below the rim. The water should be regularly renewed, at least weekly, to eliminate extreme turbidity. The pan, if galvanized, is painted annually with aluminium paint. Screens over the pan are not a standard requirement and should preferably not be used. Pans should be protected by fences to keep animals from drinking.

The site should preferably be under grass, 20 by 20 m, open on all sides to permit free circulation of the air. It is preferable that stations be located in the centre or on the leeward side of large cropped fields.

Pan readings are taken daily in the early morning at the same time that precipitation is measured. Measurements are made in a stilling well that is situated in the pan near one edge. The stilling well is a metal cylinder of about 10 cm in diameter and some 20 cm deep with a small hole at the bottom.

BOX 13
Description of Colorado sunken pan

The Colorado sunken pan is 92 cm (3 ft) square and 46 cm (16 in) deep, made of 3 mm thick iron, placed in the ground with the rim 5 cm (2 in) above the soil level. Also, the dimensions 1 m square and 0.5 m deep are frequently used. The pan is painted with black tar paint. The water level is maintained at or slightly below ground level, i.e., 5-7.5 cm below the rim.

Measurements are taken similarly to those for the Class A pan. Siting and environment requirements are also similar to those for the Class A pan.

Sunken Colorado pans are sometimes preferred in crop water requirements studies, as these pans give a better direct estimation of the reference evapotranspiration than does the Class A pan. The disadvantage is that maintenance is more difficult and leaks are not visible.

Deskripsi Panci Kelas A dan Colorado Sunken Pan

TABLE 5
Pan coefficients (K_p) for Class A pan for different pan siting and environment and different levels of mean relative humidity and wind speed (FAO Irrigation and Drainage Paper No. 24)

Class A pan	Case A: Pan placed in short green cropped area				Case B: Pan placed in dry fallow area				
	RH mean (%) →	low < 40	medium 40 -70	high > 70	Windward side distance of dry fallow (m)	low < 40	medium 40 -70	high > 70	
Light	1	.55	.65	.75	1	.7	.8	.85	
	< 2	10	.65	.75	.85	10	.6	.7	.8
	100	.7	.8	.85	100	.55	.65	.75	
Moderate	1	.75	.85	.85	1 000	.5	.6	.7

TABLE 6
Pan coefficients (K_p) for Colorado sunken pan for different pan siting and environment and different levels of mean relative humidity and wind speed (FAO Irrigation and Drainage Paper No. 24)

Sunken Colorado	Case A: Pan placed in short green cropped area				Case B: Pan placed in dry fallow area (1)				
	RH mean (%) →	low < 40	medium 40 -70	high > 70	Windward side distance of dry fallow (m)	low < 40	medium 40 -70	high > 70	
Light	1	.75	.75	.8	1	1.1	1.1	1.1	
	< 2	10	1.0	1.0	1.0	10	.85	.85	.85
	100	1.1	1.1	1.1	100	.75	.75	.8	
Moderate	1	.7	.7	.7	1 000	.7	.7	.75	
	2-5	10	.65	.7	1	.95	.95	.95	
	100	.85	.85	.9	10	.75	.75	.75	
Strong	1	.95	.95	.95	100	.65	.65	.7	
	5-8	10	.6	.6	1 000	.6	.6	.65	
	100	.55	.6	.65	1	.8	.8	.8	
Very strong	1	.75	.75	.75	10	.65	.65	.65	
	> 8	10	.8	.8	100	.55	.6	.65	
	100	.7	.75	.75	100	.55	.6	.6	
	1 000	.5	.55	.6	1 000	.5	.55	.6	
	100	.65	.7	.7	10	.7	.75	.75	
	100	.7	.75	.75	100	.5	.55	.6	
	1 000	.45	.5	.55	1 000	.45	.5	.55	

(1) For extensive areas of bare-fallow soils and no agricultural development, reduce K_{pan} by 20% under hot, windy conditions; by 5-10% for moderate wind, temperature and humidity conditions.

TABLE 7
Pan coefficients (K_p): regression equations derived from Tables 5 and 6

Class A pan with green fetch	$K_p = 0.108 - 0.0286 u_2 + 0.0422 \ln(\text{FET}) + 0.1434 \ln(\text{RH}_{\text{mean}}) - 0.000631 [\ln(\text{FET})]^2 \ln(\text{RH}_{\text{mean}})$
Class A pan with dry fetch	$K_p = 0.61 + 0.00341 \text{RH}_{\text{mean}} - 0.000162 u_2 \text{RH}_{\text{mean}} - 0.00000959 u_2 \text{FET} + 0.00327 u_2 \ln(\text{FET}) - 0.00289 u_2 \ln(86.4 u_2) - 0.0106 \ln(86.4 u_2) \ln(\text{FET}) + 0.00063 [\ln(\text{FET})]^2 \ln(86.4 u_2)$
Colorado sunken pan with green fetch	$K_p = 0.67 + 0.119 \ln(\text{FET}) - 0.0157 [\ln(86.4 u_2)]^2 - 0.0019 [\ln(\text{FET})]^2 \ln(86.4 u_2) + 0.013 \ln(86.4 u_2) \ln(\text{RH}_{\text{mean}}) - 0.000053 \ln(86.4 u_2) \ln(\text{FET}) \text{RH}_{\text{mean}}$
Colorado sunken pan with dry fetch	$K_p = 1.145 - 0.080 u_2 + 0.000903 (u_2)^2 \ln(\text{RH}_{\text{mean}}) - 0.0964 \ln(\text{FET}) + 0.0031 u_2 \ln(\text{FET}) + 0.0015 [\ln(\text{FET})]^2 \ln(\text{RH}_{\text{mean}})$
Coefficients and parameters	K_p pan coefficient [] u_2 average daily wind speed at 2 m height (m s^{-1}) RH_{mean} average daily relative humidity [%] = $(\text{RH}_{\text{max}} + \text{RH}_{\text{min}})/2$ FET fetch, or distance of the identified surface type (grass or short green agricultural crop for case A, dry crop or bare soil for case B upwind of the evaporation pan)
Range for variables	$1 \text{ m} \leq \text{FET} \leq 1\,000 \text{ m}$ (these limits must be observed) $30\% \leq \text{RH}_{\text{mean}} \leq 84\%$ $1 \text{ m s}^{-1} \leq u_2 \leq 8 \text{ m s}^{-1}$

TABLE 8
Ratios between the evaporation from sunken pans and a Colorado sunken pan for different climatic conditions and environments (FAO Irrigation and Drainage Paper No. 24)

Climate	Pan area (m^2)	Ratio $E_{\text{pan mentioned}} / E_{\text{pan Colorado}}$			
		Humid-temperate climate		Arid to semi-arid (dry season)	
Ground cover surrounding pan (50 m or more)		Short green cover	Dry fallow	Short green cover	Dry fallow
GGI 20 diameter 5 m, depth 2 m (former Soviet Union)	19.6	1.0	1.1	1.05	1.25
Sunken pan diameter 12 ft (3.66 m) depth 3.3 ft (Israel)	10.5				
BPI diameter 6 ft (1.83 m), depth 2 ft (0.61 m) (USA)	2.6				
Kenya pan diameter 4 ft (1.22 m) depth 14 in (0.356 m)	1.2				
Australian pan diameter 3 ft (0.91 m) depth 3 ft (0.91 m)	0.7		1.0		1.0
Symmons pan 6 ft ² (0.56 m ²) depth 2 ft (0.61 m)	0.6				
Aslyng pan 0.33 m ² , depth 1 m (Denmark)	0.3			1.0	
GGI 3000 diameter 0.618 cm, depth 60-80 cm (former Soviet Union)	0.3				
Sunken pan diameter 50 cm, depth 25 cm (Netherlands)	0.2	1.0	0.95	1.0	0.95

EXAMPLE 21			
Determination of ET_0 from pan evaporation using tables			
<p>Given the daily evaporation data for the first week of July for a Class A pan installed in a green area surrounded by short irrigated field crops: 8.2, 7.5, 7.6, 6.8, 7.6, 8.9 and 8.5 mm/day. In that period the mean wind speed is 1.9 m/s and the daily mean relative humidity is 73%. Determine the 7-day average reference evapotranspiration.</p>			
Pan is installed on a green surface: Case A			
Pan is surrounded by irrigated crops:	fetch _{max} =	1 000	m
Wind speed is light:	u <	2	m/s
Relative humidity is high:	RH _{mean} >	70	%
From Table 5 (for above conditions):	K _p =	0.85	-
-	E _{pan} = (8.2+7.5+7.6+6.8+7.6+8.9+8.5)/7 =	7.9	mm/day
From Eq. 55:	ET ₀ = 0.85 (7.9) =	6.7	mm/day
The 7-day average of the crop reference evapotranspiration is 6.7 mm/day			

Alat dan Bahan

Data Klimatologi bulanan yang mencakup ; temperatur maksimum, temperatur minimum, (atau temperatur rata-rata sebagai pengganti), kecepatan angin, fraksi hari cerah, ketinggian tanah (altitude), Lokasi (Latitude) suatu daerah tertentu

Metode Praktikum

Praktikum dilakukan dengan mencari nilai evaporasi atau evapotranspirasi menggunakan beberapa metode yang diminta pada paragraf berikut :

Sebuah lokasi terletak pada 40° 30' North, dan ketinggian (altitude) 120 mdpl. Data-data iklim pada bulan Oktober, November, dan Desember diberikan pada tabel berikut :

Bulan	Suhu rata-rata harian t , °C	Kelembaban rata-rata h	Kecepatan angin u_2 , m/s	Fraksi hari cerah n/D
	(1)	(2)	(3)	(4)
Oktober	14.4	0.54	0.8	0.41
November	8.3	0.20	1.3	0.28
Desember	3.9	0.56	1.7	0.25

Tentukan evapotransporasi dengan metode

- Blaney Criddle (gunakan kolom (1) untuk T, dan Tabel 1 untuk nilai p)
- Radiasi (gunakan kolom (1) untuk Trata-rata, kolom (2) untuk RH, dan kolom (3) untuk U, kolom 4 untuk n/N)
- Nomogram Penman (gunakan kolom 1, 2, 3, dan 4, serta Tabel 5 untuk nilai R_A , gunakan nomogram Penman di Gambar 3)

(meskipun metode Penman-Monteith dan Panci Evaporasi diberikan pada teori, pada praktikum ini tidak diminta mengerjakan)
