ACLS Algorithms & Notes

CPR Algorithm (CAB)

Unresponsive & No Breathing

Activate EMS/Code Blue
Get AED/Defibrillator

Check Pulse (10 Sec.)-> Present=1 breath/5 sec
No Pulse

Begin 30 Compressions & 2 Breaths

AED/Defib arrives/Check Rhythm

Shockable

Von Shockable

Give 1 Shock
Resume CPR

Check Rhythm

- <u>CAB</u>= compressions, airway, breathing- increased survival rate with early compressions & early defib, body still has oxygenated blood when person collapses pulse-less & goal is to get that circulating & prime the pump (heart)
- 2 minutes of high quality CPR & reassess & switch compressors
- No longer look, listen and feel for breathing
- Compressions harder, faster, deeper 30 in 18 sec
- Rate of at least 100/min
- Compression depth= 2 inches
- Allow complete chest recoil after each compression
- Minimize interruptions in CPR- < 10 sec & avoid over ventilation

Cardiac Arrest- Shockable Algorithm

Start continuous CPR, call EMS/code, Apply O2, Attach monitor/defibrillator

Monitor shows V. Fib/V. Tach(no pulse)

Shock @ 200 Joules

Resume CPR 2 min, Start IV/IO

Epinephrine 1 mg IV every 3-5 minutes & Airway with capnography

Shock 200 J. & resume CPR 2 min

Amiodarone 300 mg rapid IV push or 10 min drip

Shock 200 J & CPR 2 min

- Continual uninterrupted CPR & early defib=increased chance survival
- Safe defib= no O2 blowing on chest during shock. Hands free pads=more rapid defib

BLS Survey=

- Check responsiveness & breathing
- Activate EMS/Code/AED/defib
- Check Pulse no longer than 10 sec
- Defib/shock if needed

ACLS Survey=

- Progression of a BLS unconscious pt OR a conscious ACS (chest pain pt)
- Airway- patent with O2 or more advanced with capnography
- Breathing- Ambu/ET tube= 1 breath every 6-8 sec.
- Circulation= EKG, IV/IO, medication given peripherally
- Diagnosis- 5 H's & 5 T's

<u>Cardiac Arrest- Non Shockable</u> Algorithm (PEA/Asystole)

Start continuous CPR, call EMS/code, Apply O2, Attach monitor/defibrillator

Monitor Shows Asystole or PEA

CPR, IV/IO

Epinephrine 1 mg IV every 3-5 min. & Airway with Capnography

Treat Causes

- PEA= no pulse= CPR
- PEA best described as Sinus Rhythm without pulse
- Asytsole for awhile= consider terminating efforts
- Start with basics first (ABC's)
- Unconscious pt with rhythm on monitor- first priority is determine if there is a pulse
- Purpose of Rapid Response Team is to identify & treat early clinical deterioration
- Pt with epigastric pain= STAT EKG rule out MI

Capnography (PETCo2)

- Device placed between ET tube and ambu and hooked to monitor
- Measures amount Co2 exhaled by pt-waveform will increase when pt exhales
- Measure effectiveness if chest compressions
- Measures adequate coronary perfusion
- Best indicator of ET tube placement
- ROSC(return of spontaneous circulation)- target Co2 level is 35-40
- During ET suctioning withdraw no longer than 10 sec
- Avoid anchoring ET tube with ties around neck- if too tight can obstruct venous return to brain

Return of Spontaneous Circulation (ROSC)

- Pt gets <u>therapeutic hypothermia protocol</u> which lowers their body temp in order to help reduce the risk of ischemic injury to tissue & brain following a period of insufficient blood flow
- Goal
 - i. Cool for 24 hours to goal temp of 89-93 F
- Contraindication
 - i. pt responding to verbal commands
 - ii. Known pregnancy
 - iii. DNR
 - iv. Recent head trauma or traumatic arrest
 - v. In coma from other causes like; overdose, stroke, etc
 - vi. Temp already less than 93.2 F
- Indications:
 - i. Unresponsive pt not responding to commands after ROSC
 - ii. Estimated time from arrest to ROSC is less than 60 minutes
- If hypotensive with ROSC= 1-2 liters of NS or LR to keep minimum systolic pressure of 90
- 1st priority in ROSC pt is to optimize ventilation and oxygenation

Bradycardia Algorithm

Assess Clinical Condition: HR <50, B/P, Skin color, LOC, Pain, Dizziness,

Identify Treatable Causes: Apply O2, Cardiac Monitor, IV, EKG

Symptomatic

Atropine 0.5mg repeat every 5 min. to max of 3 mg

If Atropine ineffective→ Pacing

- → Dopamine Infusion 2-10 mcg/kg/min
- →Epinephrine Infusion 2-10 mcg/min

Treatable Causes

<u>Hypovia</u>= Apply O2 and assure patent airway <u>Hypovolemia</u>= Give fluid bolus of N/S or LR consider blood

<u>Hydrogen Ion= correct acidosis, advanced airway, Capnography</u>

<u>Hypothermia</u>= Keep patient warm, while in arrest <u>Hypo/hyper Kalemia</u>= check potassium & correct

<u>T</u>oxins= overdose of what?

<u>Tension Pneumothorax= needle decompression & chest tube</u>

<u>T</u>amponade(cardiac)= pericardiocentesis- remove blood from heart sac

Thrombosis (pulmonary) = PE

 $\underline{\mathbf{T}}$ hrombosis (cardiac) = MI

Tachycardia With Pulse Algorithm

Assess clinical condition- HR >150, LOC, color, Pain, dizzy, B/P, Symptomatic or non

Identify Treatable Causes: Apply O2, Cardiac Monitor, IV, EKG

Narrow Stable (SVT) Wide Stable (VT)

↓ ↓ ↓ ↓ ↓ ↓ ↓ Vagal maneuvers Amiodarone 150 mg over 10 min. Can consider Adenosine if wide monomorphic

Narrow Unstable (SVT)

Regular= 50-100 J Synch
Cardioversion

Wide Unstable

Synch 100 J

Synch 100 J

Irregular= 120-200J Synch

- Non symptomatic stable SVT do EKG 1st before meds
- <u>**D**</u>efib=<u>**D**</u>ead=200 J->V fib & Vtach- no pulse
- Synch <u>C</u>ardioversion= <u>C</u>rashing- SVT Vach with pulse

ACLS Medications Overview

Epinephrine (1:10,000)- (drug class= Vasopressor)

1 mg Rapid IV/IO push 1st for all pulseless arrests

Vasopressin (drug class= Vasopressor)

40 Units IV/IO- can replace 1st or 2nd Epi

Amiodarone

Used with ventricular rhythms (V-Fib / V-Tach)
Pulseless= 300 mg IV push or drip over 10 min
With pulse= 150 mg in 100 ml D5W drip over 10 min
Amiodarone Maintenance Drip= 450mg in 250 glass bottle of D5w Drip infusion
@ 1mg/min

Atropine

"A" for accelerate

0.5mg IV/IO—for sinus bradycardia may repeat every 5 minutes for Max of 3 mg

Adenosine

Used for SVT or stable monomorphic VT

6mg rapidly—may repeat with a 12mg x 2- always follow with NS bolus & give closest to heart

Warn patient and family about drug related symptoms:

Chest pressure, feeling faint, EKG pause

Dopamine Drip

Chronotropic drug- given for Symptomatic Bradycardia refractory to Atropine 2-10 mcg/kg/min

Epinephrine Drip

2-10 mcg/min

For symptomatic bradycardia refractory to Atropine
